

This form should be used for all taxonomic proposals. Please complete all those modules that are applicable (and then delete the unwanted sections). For guidance, see the notes written in blue and the separate document "Help with completing a taxonomic proposal"

Please try to keep related proposals within a single document; you can copy the modules to create more than one genus within a new family, for example.

MODULE 1: **TITLE, AUTHORS, etc**

Code assigned:	2009.015a,bV	(to be completed by ICTV officers)			
Short title: Create a new virus species, <i>Spring viraemia of carp virus</i> , in the genus <i>Vesiculovirus</i> , in the family <i>Rhabdoviridae</i> , in the order <i>Mononegavirales</i> (e.g. 6 new species in the genus <i>Zetavirus</i>)					
Modules attached (modules 1 and 9 are required)	1 <input checked="" type="checkbox"/>	2 <input checked="" type="checkbox"/>	3 <input type="checkbox"/>	4 <input type="checkbox"/>	5 <input type="checkbox"/>
	6 <input type="checkbox"/>	7 <input type="checkbox"/>	8 <input type="checkbox"/>	9 <input checked="" type="checkbox"/>	

Author(s) with e-mail address(es) of the proposer:

David Stone
david.stone|@cefas.co.uk

Has this proposal has been seen and agreed by the relevant study group(s)?
Please select answer in the box on the right

Yes

ICTV-EC or Study Group comments and response of the proposer:

Checked by SGS, waiting for SG confirmation

Date first submitted to ICTV: 26.05.09

Date of this revision (if different to above): 22.06.09

MODULE 2: **NEW SPECIES**

Part (a) to create and name one or more new species.

If more than one, they should be a group of related species belonging to the same genus (see Part b)

Code	2009.015aV	(assigned by ICTV officers)
To create 1 new species with the name(s):		
<i>Spring viraemia of carp virus</i>		

Part (b) assigning new species to higher taxa

All new species must be assigned to a higher taxon. This is usually a genus although it is also permissible for species to be "unassigned" within a subfamily or family.

Code	2009.015bV	(assigned by ICTV officers)
To assign the species listed in section 2(a) as follows:		
Genus:	<i>Vesiculovirus</i>	Fill in all that apply. <ul style="list-style-type: none"> • If the higher taxon has yet to be created (in a later module, below) write "(new)" after its proposed name. • If no genus is specified, enter "unassigned" in the genus box.
Subfamily:		
Family:	<i>Rhabdoviridae</i>	
Order:	<i>Mononegavirales</i>	

Reasons to justify the creation and assignment of the new species:

- Explain how the proposed species differ(s) from all existing species.
 - If species demarcation criteria (see module 3) have previously been defined for the genus, explain how the new species meet these criteria.
 - If criteria for demarcating species need to be defined (because there will now be more than one species in the genus), please state the proposed criteria.
- Provide Genbank accession numbers (not RefSeq accessions) for genomic sequences
- Further material in support of this proposal may be presented in the Appendix, Module 9

The complete genome sequence of *Spring viraemia of carp virus* (SVCV) has been deposited with Genbank (AJ318079) and it shares sufficient organisational and sequence similarities to VSIV and the other recognised Vesiculoviruses to justify recognition as a species within the genus, *Vesiculovirus*. SVCV has five major structural proteins designated N, P M, G and L. The genome is approximately 11.1kb in length with a short leader sequence that precedes the N gene and a short non translated region following the L gene. The genome does not have the Nv protein gene found in the Novirhabdoviruses.

SVCV is considered a separate species within the genus based on genetics, host range and replication characteristics.

Phylogenetic analysis based on the complete N , P and G proteins of the rhabdoviruses assigns SVCV to the *Vesiculoviruses* genus (module 9) and separated from the *Novirhabdovirus* and *Sinichuvirus*, the two rhabdovirus genera containing fish viruses.

Similar to viruses assigned to the genus, *Novirhabdovirus* and the newly proposed genus, *Sinichuvirus* (proposal submitted in May 2009), the replication temperature range of SVCV is typically lower than those of other rhabdoviruses; reflecting the aquatic poikilothermic nature of the host species. The viruses are typically isolated on cultured fish cell lines at 15-25°C.

Partial L-gene and G gene sequences are available for a range of SVCV isolates from different geographical areas and for a number of viruses that it is proposed are considered tentative species within the genus (Stone *et al* 2003; Betts *et al* 2003). Phylogenetic analysis based on partial G-gene sequences has identified four subtypes of SVCV that are separated based on geographical origins (Stone *et al.* 2003). These viruses shared 82.7%-100% nucleotide identity. Similar subgroups of SVCV are observed when analysing partial L or complete P gene sequences (Miller *et al.* 2007, Sheppard *et al.* 2007)

MODULE 9: **APPENDIX**: supporting material

additional material in support of this proposal

Annex:

Include as much information as necessary to support the proposal, including diagrams comparing the old and new taxonomic orders.

The use of Figures and Tables is strongly recommended.

Neighbor-Joining trees based on the complete (A) N protein (B) P protein and (C) G protein sequences of a range of rhabdoviruses, highlighting the genetic relationship of SVCV to the *Vesiculoviruses* and the two genera containing fish viruses.
